The global Electrosurgical Instruments and Accessories market size is predicted to grow from US$ 4390 million in 2025 to US$ 6648 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Electrosurgical Generator is the application of a high-frequency electric current to biological tissue as a means to cut, coagulate, desiccate, or fulgurate tissue. Its benefits include the ability to make precise cuts with limited blood loss. Electrosurgical devices are frequently used during surgical operations helping to prevent blood loss in hospital operating rooms or in outpatient procedures.

The electrosurgical generator and consumable market is primarily driven by the increasing demand for minimally invasive surgical procedures and advancements in electrosurgical technology. Electrosurgical generators provide high-frequency electrical currents for cutting, coagulating, and ablating tissues during surgery, offering precise and efficient tissue dissection with minimal blood loss. The growing preference for less invasive surgeries, faster patient recovery, and reduced post-operative complications fuel the adoption of electrosurgical techniques. However, the market also faces challenges, including the risk of potential complications and tissue damage associated with improper use of electrosurgical devices. Ensuring adequate training and competency among healthcare professionals in electrosurgical techniques is crucial in minimizing risks. Moreover, the high initial cost of electrosurgical equipment and consumables may be a barrier to adoption, especially in low-resource healthcare settings.
