Two-position means that the valve has two stable working positions, usually fully open and fully closed. These two positions are the main states of the valve when controlling the flow of fluid. Two-way means that the valve has two pipe connection ports, and these two interfaces are usually used to connect or cut off the path of the fluid. In a two-position two-way valve, the fluid can flow through these two interfaces when the valve is open and be cut off when the valve is closed. Double-acting means that the valve can be driven by external forces (such as pneumatic, electric or hydraulic actuators) to open and close. Compared with single-acting valves, double-acting valves require external energy to provide the force required for opening and closing. The ball valve is a valve composed of a sphere, which controls the flow of fluid through the channel on the sphere. When the sphere rotates, the connection state between the channel and the pipeline will change, thereby realizing the connection or cutoff of the fluid.
