3D printed tantalum implants are medical devices made by layering tantalum powder and fusing it with a laser or electron beam to form the desired shape. This technology can create customized implants with porous structures to promote bone growth and integration with the patient's body. Tantalum has inherent properties such as biocompatibility, corrosion resistance and bone growth promotion, making it an ideal implant material, especially in the fields of orthopedics and dentistry. 3D printing is a new processing method. The most notable feature of this technology is that it can directly form the final three-dimensional sample based on the imported workpiece model. Laser powder melting technology (LPBF) and electron beam powder melting technology (EBM) in 3D printing are often used to process tantalum implants. LPBF technology can customize metal bone implants with matching shapes and sizes according to the patient's treatment area to meet the patient's personalized customization needs.
