The global Ammonia Hydrogen Fuel Cells market size is predicted to grow from US$ 240 million in 2025 to US$ 535 million in 2031; it is expected to grow at a CAGR of 14.3% from 2025 to 2031.

The working principle of ammonia-hydrogen fuel cells is based on the catalytic decomposition of ammonia and the electrochemical oxidation of hydrogen. In a fuel cell, ammonia is first cracked into hydrogen and nitrogen by heating, and then the hydrogen undergoes an oxidation reaction at the anode, releasing electrons that are transferred to the cathode through an external circuit, while generating protons. At the cathode, protons combine with oxygen to generate water, while consuming electrons transferred from the anode. The electrical energy generated in this process can be used to drive various devices.
