The global Automotive Parking Lock Actuator Motor market size is predicted to grow from US$ 868 million in 2025 to US$ 1206 million in 2031; it is expected to grow at a CAGR of 5.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Automotive Parking Lock Actuator Motor is integrated in the electronic parking brake system EPB, converts electrical energy into mechanical energy, drives the brake caliper through the transmission mechanism to achieve parking brake, and realizes automatic locking and release of the parking lock. It has the characteristics of small size, high power density, large output torque, high speed, long life, low noise, and strong anti-electromagnetic interference ability.

The Electrical Park Brake (EPB) refers to the technology that integrates temporary braking during driving and long-term braking after parking, and realizes parking braking by electronic control. The electronic handbrake is a technology that realizes parking braking by electronic control. Its working principle is the same as that of the mechanical handbrake, and both brake by tightening the rear wheel brake shoe by cable.

There are two main types of automotive parking lock actuator motors. The caliper type is installed on the caliper, and a motor is installed on each of the two rear wheels. Its advantages are fast system response and the left and right wheels can be controlled separately. The disadvantage is high cost. The cable-type uses a motor to drive the two calipers of the motor through the cable, and its working mode is similar to that of the

mechanical handbrake. Its advantage is that the cost is relatively low, and its disadvantage is that the response is relatively slow.
