Abstracts

According to our (Global Info Research) latest study, the global Zirconiated Tungsten Electrode market size was valued at US$ 11.89 million in 2025 and is forecast to a readjusted size of US$ 13.53 million by 2032 with a CAGR of 1.9% during review period.

Zirconiated tungsten electrodes are non-radioactive tungsten-based electrodes produced by adding a specific proportion of zirconium oxide as a rare-earth oxide additive and employing processes such as powder metallurgy, pressing, sintering, drawing, and grinding. They serve primarily as non-consumable electrodes in tungsten inert gas (TIG) welding, facilitating high-quality welding of metal materials by stabilizing the arc and conducting welding current. In 2025, global sales volume reached 305 tons with a production capacity of approximately 400 tons; the average selling price was US$37.9 per kilogram, and the average gross profit margin ranged from 25% to 35%.

Compared to pure tungsten electrodes, the addition of zirconiated oxide enhances electron emission capability, resistance to burn-off, arc stability, and resistance to contamination from melting. These electrodes are particularly well-suited for AC TIG welding, demonstrating superior performance when welding aluminum alloys, magnesium alloys, and other easily oxidized materials. Unlike thoriated tungsten electrodes, which contain the radioactive element thorium oxide (ThO?), zirconiated tungsten electrodes are free of radioactive substances, offering better environmental and operational safety.

Technological advancements in zirconiated tungsten electrodes have primarily focused on enhancing ablation resistance, improving arc stability, mitigating radioactive risks,

and ensuring manufacturing consistency. Conventional zirconium-tungsten electrodes typically utilize zirconium dioxide (ZrO?) as the primary dopant and are manufactured through processes such as powder metallurgy, pressing, sintering, wire drawing, and surface treatment. Current industry efforts to extend electrode service life and improve welding stability center on optimizing zirconia content, grain refinement, uniform doping, and composite rare-earth doping techniques. Meanwhile, driven by stricter environmental regulations, non-radioactive tungsten electrodes are increasingly replacing thoriated tungsten electrodes, leading to a rising adoption rate of eco-friendly alternatives such as zirconium-tungsten, cerium-tungsten, and lanthanum-tungsten electrodes. Future technological development will trend toward high-purity materials, small-batch customization, and specialized electrodes optimized for automated welding equipment.
