Abstracts

The global Gas Wall Hung Boilers market size is predicted to grow from US$ 12182 million in 2025 to US$ 17640 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Gas wall hung boilers are compact, wall-mounted heating units fueled by natural gas or liquefied petroleum gas, designed to provide space heating and/or domestic hot water for residential and small commercial buildings. They integrate combustion, heat exchange, circulation, control, and safety systems into a single unit, heating water that circulates through radiators, underfloor heating, or domestic hot water circuits. Gas wall hung boilers are valued for their compact size, flexible installation, high efficiency, and independent temperature control, with condensing models further improving efficiency by recovering latent heat from flue gases.

The gas wall hung boiler market is primarily driven by upgrades in residential heating and increasingly stringent energy-efficiency regulations. Urbanization and rising living standards boost demand for decentralized heating, on-demand hot water, and precise temperature control, accelerating replacement of centralized or inefficient systems. Stricter emissions standards promote the adoption of high-efficiency condensing boilers over conventional models. In addition, renovation of aging building stock, preference for space-saving solutions in new housing, and the integration of smart controls and connectivity features continue to support market growth.
