The global Automotive Leaf Spring market was valued at 4534.3 Million USD in 2021 and will grow with a CAGR of 3.5% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market verdors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

The automobile leaf spring is the most traditional elastic component in the automobile suspension system, and has the advantages of good reliability, simple structure, short manufacturing process flow, low cost and greatly simplified structure.The leaf spring has simple structure, reliable operation, low cost and simple maintenance. It can transmit various forces and moments, determines the jumping trajectory of the wheel, and at the same time, it also has a certain friction damping effect. However, it can only be used for non-independent suspensions, which are heavy, stiff, poorly comfortable, and have a long longitudinal dimension (not conducive to shortening the front and rear overhangs of the car), and the leaf spring pins at the joint with the frame are prone to wear.
