The global Plant Extraction Centrifuge market size is predicted to grow from US$ 360 million in 2025 to US$ 461 million in 2031; it is expected to grow at a CAGR of 4.2% from 2025 to 2031.

Plant extraction centrifuge is a device that uses a motor to drive the drum to rotate at high speed. Under the shear force generated by the rotation of the drum or blades, two materials with different densities and immiscible (usually plant extracts and solvents) are mixed and transferred, and then quickly separated under the centrifugal force generated by the high-speed rotation of the drum. Under the centrifugal force generated by the high-speed rotation of the drum, the liquid with higher density gradually moves away from the center of the drum and toward the drum wall, while the liquid with lower density gradually moves away from the drum wall and toward the center. Finally, the two phases of liquid are thrown into the collection chamber through their respective channels to complete the separation of the two phases.

United States market for Plant Extraction Centrifuge is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
