Soluble Microcarriers are a type of microcarrier designed to dissolve or break down in the culture medium after a specific period, enabling the recovery of adhered cells without the need for physical separation. These microcarriers typically consist of materials that are water-soluble or can be degraded by enzymatic or chemical processes, allowing for easy cell harvesting once the cells have proliferated. Soluble microcarriers are commonly used in cell culture, tissue engineering, and biopharmaceutical production, as they simplify downstream processing by eliminating the need for manual removal of microcarriers, while maintaining the integrity of the cultured cells.

United States market for Soluble Microcarriers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
