The global Stem Cell Factor(SCF) market size is predicted to grow from US$ 112 million in 2025 to US$ 189 million in 2031; it is expected to grow at a CAGR of 9.0% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Stem Cell Factor (SCF), also known as c-Kit ligand, mast cell growth factor (MGF), or steel factor, is a cytokine, which is a type of signaling protein that plays a crucial role in the regulation of hematopoiesis (the formation of blood cells) and the development and function of various cell types. SCF is essential for the survival, proliferation, and differentiation of hematopoietic stem cells (HSCs), as well as for the development of certain other cells, such as mast cells, melanocytes, and germ cells.

The Stem Cell Factor (SCF) industry is currently experiencing several significant trends. Firstly, technological innovation is a key driving force. The integration of automation and artificial intelligence is enhancing production efficiency and precision, while the development of 3D bioprinting technology is revolutionizing tissue engineering, which is of great significance for the application of SCF in regenerative medicine. At the same time, gene editing technologies such as CRISPR are being used to modify stem cells at the genetic level, improving the therapeutic potential of SCF. Secondly, the application scenarios are becoming more diverse. SCF is not only widely used in the research and treatment of hematopoietic stem cells and cancer but also shows great potential in the treatment of neurological diseases, organ generation, and other fields. In addition, personalized medicine is developing rapidly. Customizing stem cell therapies based on
