The Posterior Occipital Cervical Thoracic Fixation System is a medical device used in spinal surgery to stabilize and support the cervical and thoracic spine from the posterior (back) approach. This fixation system is designed to provide stability to the spine, often in cases where there is instability, deformity, or trauma. The system typically includes a combination of screws, rods, connectors, and other components that are surgically implanted to achieve spinal fusion and maintain the alignment of the vertebral segments.

Continued exploration of advanced materials, such as titanium alloys or advanced polymers, for screws, rods, and other components to enhance strength, durability, and biocompatibility.
