Abstracts

The Latin America, Middle East and Africa Smart Biopsy Market would witness market growth of 5.97% CAGR during the forecast period (2019-2025).
Ever-miniaturizing technology in medical imaging has given rise to certain new and exciting opportunities. In recent times, the medical industry has witnessed the development of a complex lens system that fits inside a syringe, an optical sensor that fits for precision guidance at the end of an epidural needle, and a camera-loaded catheter that streams live from inside arteries and even removes plaque simultaneously. After scientists developed a new "smart needle" that uses a mini laser to identify diseased tissue within seconds, cancer detection would become much faster and easier in the future. Scientists have demonstrated the laboratory functions of the technique and have launched a major three-year clinical trial in 2019 to test it in people. They have so far focused on lymphoma but are hopeful that the technique can also be used to detect other forms of diseases such as breast and prostate cancer further down the line. Apparently, lymphoma diagnosis can be an invasive process involving a surgical biopsy accompanied by a nerve-wracking wait for the result that can often take two weeks or more. The smart needle uses light to almost instantly identify cancerous tissues. Using a method called Raman spectroscopy, when a laser embedded in the needle reflects on it, the' optical biopsy' measures the light dispersed by tissues. The light is absorbed differently from healthy and diseased tissues, which ensures that doctors will immediately make a diagnosis.
