Central nervous system biomarker detection refers to the identification of specific biomolecules or physiological indicators related to central nervous system diseases through measurement of body fluids (such as blood, cerebrospinal fluid) or imaging methods, for early diagnosis, disease monitoring, efficacy evaluation, and prognosis prediction of diseases. These biomarkers typically include proteins, genetic and epigenetic markers, metabolites, and imaging markers. The core value of the detection lies in improving the diagnostic accuracy of neurological diseases such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, etc., and promoting the development of personalized medicine.

In recent years, the global market size for central nervous system biomarker detection has been continuously growing. The increasing burden of diseases, technological advancements, and the development of personalized medicine are the main driving factors. With the intensification of global aging, the number of patients with neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease has surged; The breakthroughs in gene sequencing and imaging technology have driven the discovery of biomarkers, and artificial intelligence and machine learning provide more accurate and efficient data analysis for biomarker detection; In addition, biomarkers play an important role in developing personalized healthcare plans, and all of these factors have promoted market expansion. In the global market, well-known companies such as Roche, Merck, Takeda, etc. have occupied a large market share with advanced research facilities, technology, and a large amount of resource investment, and have
