The global Aluminum Alloy Vacuum Chamber market size is predicted to grow from US$ 665 million in 2025 to US$ 1243 million in 2031; it is expected to grow at a CAGR of 11.0% from 2025 to 2031.

The heating method of a vacuum chamber is divided into two types: internal heating and external heating. External heating is heating outside the chamber, relying on the chamber wall to conduct heat in, and transferring heat through thermal radiation; Internal heating refers to heating directly inside the vacuum chamber. Compared to internal heating, external heating has hysteresis, and the temperature control accuracy of internal heating is more precise compared to external heating. Aluminum alloy vacuum chambers are mainly used in the semiconductor industry, especially in plasma cleaning machines and etching machines. Plasma cleaning machine chambers have been widely used in the industry, particularly in processes such as LCD surface mount, LED packaging, integrated circuit component packaging, IC packaging, engineering plastics, and surface treatment of special hard materials.
