## Abstracts

The global Automated Oligonucleotide Synthesizer market size is predicted to grow from US$ 264 million in 2025 to US$ 485 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

Automated oligonucleotide synthesizers are usually based on the principle of solid phase synthesis and use the phosphoramidite method for synthesis. During the synthesis process, appropriate reagents are delivered to individual wells containing growing oligonucleotide chains, which are bound to solid supports. Each well has a filter bottom to facilitate the removal of used reagents while retaining the solid support matrix. The synthesis environment is controlled by a sealed design, and the entire instrument is automated by computer control.
