Abstracts

The global Autonomous Logistics Delivery Vehicle market size is predicted to grow from US$ 147 million in 2025 to US$ 2447 million in 2032; it is expected to grow at a CAGR of 36.3% from 2026 to 2032.

A Autonomous Logistics Delivery Vehicle is a specialized, intelligent wheeled platform equipped with Level 4 or higher autonomous driving technology, designed to address inefficiencies in "last-mile" delivery and "inter-zone" logistics. Unlike single-purpose delivery bots, these vehicles are characterized by higher payload capacities and sophisticated multi-compartment structures, enabling them to handle a diverse array of goods ranging from courier parcels and grocery orders to industrial components.

The operational core of these vehicles relies on highly redundant perception suites, integrating LiDAR, millimeter-wave radar, and multi-lens cameras to provide 360-degree situational awareness. This sensory data is processed by high-performance onboard computing platforms running advanced perception, prediction, and decision-making algorithms. Within a Smart Logistics framework, self-driving delivery vehicles operate autonomously on sidewalks or non-motorized lanes and maintain real-time connectivity with cloud-based dispatch centers via 5G networks. This integration allows for dynamic obstacle avoidance, precision docking, and scheduled pickups. The large-scale deployment of such vehicles significantly reduces reliance on manual labor, enhancing the standardization and energy efficiency of short-haul urban transport.

In 2025, global Autonomous Logistics Delivery Vehicle production reached approximately 30000 units, and average price was 5000 usd/unit, with gross margin 30%.
