The global Activated Carbon Cabin Air Filters market size is predicted to grow from US$ 1809 million in 2025 to US$ 2167 million in 2031; it is expected to grow at a CAGR of 3.0% from 2025 to 2031.

An Activated Carbon Cabin Air Filter is a specialized type of air filter designed to be installed in a vehicle's ventilation system, specifically within the cabin area. It is made from activated carbon (also known as activated charcoal), which is a highly porous material that has been treated to enhance its surface area and absorb a wide range of contaminants, such as gases, odors, smoke, and volatile organic compounds (VOCs). These filters are primarily used to purify the air inside the vehicle, ensuring a clean, fresh, and healthy environment for passengers.

Activated carbon cabin air filters are typically placed in the vehicle’s air intake system or HVAC (Heating, Ventilation, and Air Conditioning) system. Their role is to filter out harmful gases like carbon monoxide, sulfur dioxide, and ozone, as well as pollutants from industrial emissions, dirt, dust, pollen, and allergens. Additionally, these filters help eliminate unpleasant odors, such as those from cigarette smoke, pollution, or food smells, enhancing the comfort of passengers during travel.

The activated carbon used in these filters works through a process called adsorption, where gases and particles from the air are attracted to and trapped on the surface of the carbon. This ensures that the air entering the vehicle cabin is free from harmful chemicals and smells, offering a higher level of air quality.

The report only studies the activated carbon cabin air filters used in various transportation devices such as cars and airplanes, etc.
