Abstracts

The global Advanced Packaging Underfill Materials market size is predicted to grow from US$ 506 million in 2025 to US$ 941 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

Advanced packaging underfill materials are electrically insulating polymer systems used in flip-chip, wafer-level, 2.5D/3D integration, chiplet, and high-bandwidth-memory packages. Typically formulated with epoxy resins, curing agents, and fine inorganic fillers, they fill the gaps among dies, bumps, and substrates through capillary flow, pre-application, thermocompression bonding, or molding, redistributing CTE-mismatch stress, protecting microbumps and solder joints, and improving warpage control, moisture resistance, thermal-cycle performance, and mechanical-shock reliability. Key purchasing parameters include flow speed, viscosity, filler particle size, cure temperature, glass-transition temperature, CTE, thermal conductivity, ionic contamination, and reworkability. The blended gross margin is approximately 45%.

Demand is being driven by AI, high-performance computing, high-bandwidth memory, and chiplet architectures, which are moving packages toward larger bodies, multiple dies, and finer interconnect pitches. CTE mismatch, localized thermal stress, and warpage therefore become more severe. Advanced packaging underfills are shifting from optional assembly aids to critical reliability materials, with demand extending beyond drop protection in consumer electronics to data centers, telecommunications infrastructure, automotive computing, and high-reliability industrial equipment.

Product development focuses on balancing fast flow with high filler loading. Capillary underfills must achieve low voiding across narrow gaps and long flow paths; molded underfills emphasize one-step encapsulation, low warpage, and large-area package

compatibility; NCP and NCF materials support thermocompression bonding and microbump interconnects. High thermal conductivity, low-temperature rapid cure, low ionic contamination, flux compatibility, and reworkability are becoming key differentiators, while suppliers increasingly co-develop materials with dispensing, bonding, molding, and cleaning processes.

The high-end market remains led by international materials suppliers with long qualification histories, while manufacturing and customer validation are concentrated in East Asia's advanced-packaging ecosystem. Local suppliers can compete through responsive technical service, customized formulations, and supply-chain security, but qualification cycles are lengthy and volume production can be affected by batch consistency, filler sedimentation, interfacial adhesion, void control, and long-term reliability. Suppliers integrating resin design, filler surface treatment, formulation, and package-level validation are better positioned for higher-value programs.
