The global Closed Loop Neurostimulator market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Closed loop neurostimulator is a cutting-edge technology based on the closed-loop concept of brain-computer interface, which combines the functions of neuroelectrophysiological diagnosis and neuroelectric stimulation therapy. This device is mainly used in the field of neuromodulation treatment such as intractable epilepsy.

Closed-loop neurostimulation is a relatively new technology, mainly used to treat neurological diseases such as refractory epilepsy. According to WHO data, about 50 million people suffer from epilepsy worldwide, with about 5 million new epilepsy patients each year, and the risk of premature death in epilepsy patients is three times that of the general population.

At present, some representative closed-loop neurostimulator products have been approved for marketing worldwide, such as NeuroPace's responsive neurostimulation (RNS) system and Medtronic's deep brain stimulation system Percept? PC. These products have achieved significant clinical results in the treatment of neurological diseases such as refractory epilepsy.
