An endoscopic basket for intestinal polyp extraction is a medical device designed to assist in the removal of polyps from the intestines during endoscopic procedures. The basket consists of a fine mesh that is usually made of stainless steel or other biocompatible materials, and it is deployed through an endoscope into the intestinal tract. Once positioned around the polyp, the basket is closed, securely capturing the polyp. It can then be extracted from the body using the endoscope. This device is commonly used in procedures such as colonoscopies to remove benign polyps before they can develop into cancer. The use of an endoscopic basket is minimally invasive, providing a safer, more efficient method for polyp removal with minimal discomfort to the patient.
