The global Green Picosecond Laser market size is predicted to grow from US$ 292 million in 2025 to US$ 363 million in 2031; it is expected to grow at a CAGR of 3.7% from 2025 to 2031.

Green picosecond laser is an ultrashort pulse laser with an output wavelength usually in the range of 532 nanometers. It is obtained by converting the fundamental wave (usually 1064 nanometer infrared laser) through double frequency technology (frequency doubling crystal). Its pulse width is in the order of picoseconds (10??? seconds), with the characteristics of high peak power, ultrashort pulse and low thermal effect. It is suitable for high-precision micromachining, material surface treatment, biomedical imaging and laser display. Green picosecond laser is favored for its low damage ability in processing transparent materials (such as glass) and heat-sensitive materials.

United States market for Green Picosecond Laser is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
