Abstracts

According to this study, the global Human-mouse Chimeric Antibody market size will reach US$ 27998 million by 2031.

A human-mouse chimeric antibody is a type of monoclonal antibody engineered by combining the variable regions of a mouse antibody (which determines antigen specificity) with the constant regions of a human antibody. This design reduces immunogenicity in humans compared to fully murine antibodies, while retaining the mouse antibody's ability to bind its target. Chimeric antibodies are typically around 65–70% human and are used in the treatment of cancers, autoimmune diseases, and transplant rejection.

United States market for Human-mouse Chimeric Antibody is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Human-mouse Chimeric Antibody is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Human-mouse Chimeric Antibody is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
