The global Infrared Inoculation Loop Sterilizer market size is predicted to grow from US$ 360 million in 2025 to US$ 463 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

The infrared inoculation loop sterilizer works based on the principle of electronic infrared. It uses the thermal and chemical effects of infrared rays to denature the proteins of bacteria, viruses and other microorganisms through radiation, thereby destroying their structure and function to achieve the purpose of sterilization. Specifically, the items to be sterilized are placed in a high-efficiency ceramic infrared heating tube with a temperature of hundreds of degrees Celsius (different models have different temperatures, such as 800?, 825?±25?, nearly 900?, etc.), and are burned at high temperature for several seconds (such as 34 seconds, 57 seconds) to achieve the sterilization effect. The infrared inoculation loop sterilizer is mainly used for high-temperature sterilization and disinfection of small items such as inoculation loops and inoculation needles. It can completely replace traditional alcohol lamps and provide a more convenient and quick disinfection method. It is widely used in biological safety cabinets, clean workbenches, exhaust fans, mobile vehicles and other environments. It can even be used conveniently in harsh environments such as the wild, and high-temperature sterilization and disinfection can be performed at any time.

United States market for Infrared Inoculation Loop Sterilizer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
