The global Condensed Nucleus Particle Counter market size is predicted to grow from US$ 78.6 million in 2025 to US$ 100 million in 2031; it is expected to grow at a CAGR of 4.0% from 2025 to 2031.

A condensation particle counter is an instrument used to detect and count condensation particles. Condensation nuclei particles mainly include cloud droplets, ice crystals and other condensed particles, and their concentration and size are of great significance for climate research, air pollution monitoring and environmental assessment. One of the development trends of condensation particle counters is miniaturization and portability. Traditional condensation particle counters are usually large and require more complicated equipment and operations, which limits their application in field monitoring and mobile measurement. With the advancement of technology, condensation particle counters are developing in the direction of miniaturization and portability for more convenient on-site measurement and mobile monitoring.
