The global Low Loss Anti-Resonant Fibres market size is predicted to grow from US$ 19.6 million in 2025 to US$ 28.3 million in 2031; it is expected to grow at a CAGR of 6.3% from 2025 to 2031.

Low loss anti-resonant fibers are a type of specially designed optical fiber that features an anti-resonant structure to significantly reduce signal attenuation and improve the performance of optical communication systems. These fibers typically exhibit high mode isolation and low transmission losses, making them ideal for long-distance, high-speed data transmission. The anti-resonant structure minimizes scattering and other loss factors, allowing light signals to maintain higher quality as they travel through the fiber. Low loss anti-resonant fibers are widely used in high-performance communication networks, data centers, and fiber optic sensors, particularly in applications requiring high precision and low error rates.
