The global Deproteinized Dairy Mineral Lactose Powder market size is predicted to grow from US$ 639 million in 2025 to US$ 845 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

Deproteinized dairy mineral lactose powder is obtained by ultrafiltration or nanofiltration of milk or whey to remove proteins, followed by concentration and spray drying of the permeate. It mainly contains lactose and milk minerals, with very low protein content. The powder is light-colored, highly soluble, and mildly milky in flavor. Owing to its nutritional value, sweetness, and functional properties, dairy permeate is widely used as a cost-effective source of milk solids in bakery, confectionery, dairy beverages, animal feed, and fermentation applications.

In 2024, global Deproteinized Dairy Mineral Lactose Powder production reached 1.1603 million tons, with an average selling price of US$544 per ton. Typical single-line production capacity is approximately 50,000-100,000 tons, and the industry's gross profit margin is approximately 10%-20%. Cost structure: Direct materials account for approximately 35%, manufacturing costs account for approximately 40%, and labor costs account for approximately 8%. Industry chain: Upstream consists of milk source supply and primary processing; downstream industries include food and beverage, animal feed, etc.
