The global Near-field Acoustic Holography Software market size is predicted to grow from US$ 172 million in 2025 to US$ 275 million in 2031; it is expected to grow at a CAGR of 8.1% from 2025 to 2031.

Near-field acoustic holography technology is a method that uses the sound field response distribution measured by a microphone array with a certain geometric shape as the input of a three-dimensional sound field model to reversely calculate and reconstruct the distribution of acoustic physical quantities in the near field of the sound source or on the surface of the sound source. Near-field acoustic holography software is based on this technical principle and uses computer algorithms and data processing technology to achieve the identification, positioning and analysis of sound sources. Near-field acoustic holography software can receive and process sound field data from microphone arrays, including preprocessing work such as signal amplification, filtering, and denoising. Using the collected sound field data, the software reconstructs the distribution of acoustic physical quantities in the near field or surface of the sound source, such as sound pressure, particle velocity, etc., through reverse calculation and three-dimensional reconstruction algorithms.

United States market for Near-field Acoustic Holography Software is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
