The global New Energy Ship Fuel Supply System market size is predicted to grow from US$ 1791 million in 2025 to US$ 18200 million in 2031; it is expected to grow at a CAGR of 47.2% from 2025 to 2031.

Ship fuel supply system is a system used on ships to store, transport and supply fuel. The design and operation of this system is critical to the ship's performance and energy efficiency. New energy ships mainly use low-carbon fuels to replace traditional fuels, which can be divided into LNG, methanol, ammonia and hydrogen according to the fuel type.

The ship fuel supply system is a key component to ensure the power and navigation stability of the ship. With the continuous growth of the global shipping industry and the increasingly stringent international environmental protection requirements, the development of the ship fuel supply system has ushered in unprecedented challenges and opportunities in recent years. The traditional ship fuel supply system mainly relies on heavy fuel oil (such as heavy fuel oil and marine diesel). However, with the increasing pressure of environmental protection and the restrictions on sulfur emissions by the International Maritime Organization (IMO), especially the implementation of the IMO 2020 global sulfur limit in 2020, the ship fuel supply system needs to undergo profound changes in technology and equipment.

The market for ship fuel supply systems is facing several significant changes. First, the diversification of fuel types is becoming a trend. In order to meet the challenges of environmental regulations, ship fuel supply systems have begun to gradually transform

to green energy such as low-sulfur fuel, liquefied natural gas (LNG) and biofuels. The popularity of low-sulfur fuel requires ships to add desulfurization devices (such as scrubbers) to the fuel supply system to ensure that emissions meet the new emission standards. In addition, liquefied natural gas (LNG), as a clean alternative energy source, has gradually become one of the mainstream fuel options for new ships due to its low sulfur, low nitrogen and low particulate matter characteristics. With the gradual popularization of LNG fuel, the design and technology of ship fuel supply systems are also developing towards higher safety and efficiency. At the same time, the application of biofuels has gradually attracted attention in the shipping industry, especially in some areas with strict environmental protection policies, where biofuels have become one of the important alternatives.

The market for ship fuel supply systems is facing the dual challenges of transformation and innovation. The introduction of green and low-carbon technologies, intelligent and digital technologies has promoted the rapid development of this field. With the continuous updating of international environmental regulations, the diversification of fuel types and technological progress, ship fuel supply systems will gradually develop in a more efficient, environmentally friendly and intelligent direction. In the next few years, ship fuel supply systems will not only be limited to traditional fuel delivery functions, but will also incorporate more advanced technologies to meet the global shipping industry's needs for environmental protection, energy saving, safety and intelligence, and promote the shipping industry to move towards a greener and more sustainable direction.

Global key players of New Energy Ship Fuel Supply System include Mitsubishi Shipbuilding, TGE Marine Gas Engineering, CSSC, Wartsila, Alfa Laval, etc. The top five players hold a share about 88%. China is the largest market, and has a share about 40%, followed by Europe and Japan with share 18% and 13%, separately. In terms of product type, LNG Fuel Gas Supply System is the largest segment, occupied for a share of 93%. In terms of application, Cargo Ship is the largest field with a share about 71 percent.
