The global Non-Specific Endonuclease market size is predicted to grow from US$ 90 million in 2025 to US$ 190 million in 2031; it is expected to grow at a CAGR of 13.3% from 2025 to 2031.

Non-specific endonucleases are a class of enzymes that can cut phosphodiester bonds in DNA or RNA molecules. The cutting of these enzymes does not depend on a specific nucleotide sequence, but can cut at any position of the molecular chain. It can degrade all forms of DNA and RNA, including single-stranded, double-stranded, linear, circular, natural and denatured nucleic acids. Unlike specific endonucleases, non-specific endonucleases do not recognize and bind to specific DNA sequences, but randomly cut the target molecules. This makes them important in applications that require extensive degradation or cutting of nucleic acid chains, such as genomics research, RNA degradation, sample preparation, and certain types of nucleic acid modification experiments.
