The global Oil Immersed Iron Core Reactor market size is predicted to grow from US$ 895 million in 2025 to US$ 1256 million in 2031; it is expected to grow at a CAGR of 5.8% from 2025 to 2031.

The oil-immersed iron core reactor is a type of electrical equipment that uses oil as a cooling medium. It is widely used in power transmission and distribution systems, industrial power grids, and special power application scenarios. It uses the inductance characteristics of the iron core and the coil to provide reactance to adjust the grid voltage, limit short-circuit current, or filter harmonics. Its design features and performance make it suitable for high-voltage and high-power applications. Reactance is generated through inductance, providing resistance to rapidly changing currents. When the current or voltage in the grid is abnormal, the reactor plays a role in protecting the equipment and stabilizing the operation of the grid. Oil as a cooling medium can effectively dissipate heat, ensuring that the equipment can operate stably for a long time under high load conditions.

United States market for Oil Immersed Iron Core Reactor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Oil Immersed Iron Core Reactor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
