Dressing Forcep is a hand-held device that surgeons in multiple areas can use to grasp and manipulate different types of wound dressings, in order to perform wound debridement and remove necrotic tissue from the wound’s surface.

Dressing forceps, also known as medical clips or tweezers, are a common medical instrument used for handling dressings and other medical supplies, as well as for some delicate operations when performing surgical procedures. Dressing forceps typically have an elongated design that is shaped like a clip, with two handles and a sharp jaw portion. The jaw portion is usually flat or slightly curved to allow gripping of dressings or other items. Dressing forceps can be used to manipulate dressings, such as changing gauze or bandages on a wound. During surgery, doctors may use dressing forceps to pick up or manipulate small tissues, blood vessels, or other medical supplies. Dressing forceps can be used to bandage a wound and secure the dressing on the patient's body.
