Drone oblique photography is a technology that uses drones equipped with oblique photography equipment to collect images of the ground at an oblique perspective, and then reconstructs a three-dimensional model through image processing technology. Specifically, this technology can collect images from different angles such as vertical and oblique angles at the same time by carrying multiple sensors (such as a five-lens camera, including downward, forward, rear, left and right cameras) on the same flight platform, thereby obtaining more complete and accurate information about ground objects.
