The global Pseudo-UTP market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Pseudouridine-5'-O-triphosphate (Pseudo-UTP) is an important modified nucleoside-5'-O-triphosphate. In the chemical structure of pseudouridine triphosphate, ribose is not connected to the N1 of uracil, but to the C5 of the pyrimidine ring. This structure makes pseudouridine triphosphate a special modified nucleoside in RNA molecules.

Pseudouridine triphosphate is one of the basic raw materials for polymerase-mediated RNA molecule synthesis. During RNA synthesis, it can replace uridine triphosphate (UTP) and participate in the extension of RNA chain. By replacing uridine in RNA, pseudouridine can reduce the immunogenicity of mRNA and thus improve its stability. This enhanced stability contributes to the long-term existence and effective expression of mRNA in cells. The introduction of pseudouridine can also optimize the translation efficiency of mRNA, so that the protein it expresses has higher yield and better quality.

In summary, pseudouridine triphosphate is an important modified nucleoside-5'-O-triphosphate, which has broad application prospects in RNA synthesis, mRNA vaccine and drug development, gene therapy, and biological research.

United States market for Pseudo-UTP is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
