Railway brake pads and shoes are key components of a train’s braking system that create friction to slow down or stop the train. Brake pads are typically used in disc brake systems, pressing against a rotating disc to generate friction, and are common in modern passenger trains. Brake shoes, on the other hand, are used in tread brake systems, where they press directly onto the wheel tread. Both components are made from high-friction, heat-resistant materials and are designed to withstand heavy loads and harsh operating conditions. They play a critical role in ensuring the safety and efficiency of railway operations.
