Rapid bladder cancer tests are diagnostic tools designed to quickly detect the presence of bladder cancer in patients. These tests focus on identifying specific biomarkers or abnormal cellular changes in urine, which are associated with bladder cancer. One of the most common approaches includes urinary cytology, where cells from urine samples are examined under a microscope. Additionally, molecular tests such as fluorescence in situ hybridization (FISH) and genetic tests are increasingly being used to detect specific genetic mutations or alterations linked to bladder cancer. These rapid tests offer advantages like non-invasive sample collection and the ability to obtain results quickly, making them valuable for early detection, monitoring recurrence, and guiding treatment decisions.
