Expanding air shafts are a special type of mechanical shaft component, mainly used in unwinding and rewinding equipment for winding materials. It expands the outer diameter of the shaft by filling it with compressed air, thereby achieving the tightening or loosening of the core, facilitating the loading and unloading of materials, and providing stable support and uniform tension during the winding process. The shaft body is generally a hollow metal cylinder, usually made of high-quality steel, such as stainless steel or carbon steel. This is the main part of the air shaft and can withstand certain axial and radial loads. There are many air expansion units (air bags or air bags) distributed along the circumferential direction on the surface of the shaft body. These air expansion units are the key part to achieve shaft diameter expansion.
