The global Sanitary Grade Capillary Heat Exchanger market size is predicted to grow from US$ 276 million in 2025 to US$ 356 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

Capillary heat exchanger is an efficient and compact heat exchange device widely used in the process of pharmaceutical factories. It utilizes the phase change of the fluid inside the capillary to transfer heat, and has the advantages of high heat transfer efficiency, small footprint, energy conservation, and environmental protection. In pharmaceutical production, capillary heat exchangers can be used for processes such as heating, cooling, evaporation, and condensation, providing strong support for drug production and quality control. The working principle of capillary heat exchanger is based on Newton's law and surface tension. When two fluids with different temperatures flow in a capillary tube, heat transfer occurs due to the temperature difference. Heat is transferred from a high-temperature fluid to a low-temperature fluid, causing the temperatures of the two fluids to reach equilibrium. In this process, the surface tension of the inner wall of the capillary plays a crucial role, which enables the fluid to form a stable flow state inside the capillary, thereby achieving efficient heat transfer. During the production process of active pharmaceutical ingredients, capillary heat exchangers can be used for heating, cooling, evaporation, and other technological processes. For example, during the fermentation process, capillary heat exchangers can be used to control the fermentation temperature; During the crystallization process, it can be used to recover solvents; During the drying process, it can be used to control the temperature of the material. During the production process of formulations, capillary heat exchangers can be used for heating, cooling, evaporation, and other processes of liquid

formulations. For example, in the production process of oral liquid, it can be used to control the temperature of the medicine solution; In the production process of tablets, it can be used to control the tablet pressing temperature; In the production process of injections, it can be used to control the filling temperature. In the field of biomedicine, capillary heat exchangers can be used for processes such as separation, purification, and concentration of biological products. For example, in the production process of antibody drugs, it can be used to control the temperature of antibody solutions; In the production process of vaccines, it can be used to control the temperature of inactivated viruses; In the production process of gene therapy drugs, it can be used to control the temperature of gene expression vectors. In addition to the above-mentioned application fields, capillary heat exchangers can also be applied in medical devices, cosmetics, food additives, and other fields. For example, in the production process of medical devices, it can be used to control the temperature of disinfectant; In the production process of cosmetics, it can be used to control the temperature of lotion; In the production process of food additives, it can be used to control the temperature of the reaction solution.
