Shell-and-tube Type Recuperative Thermal Oxidizer is a combustion device that controls volatile organic compounds (VOCs), hazardous air pollutants (HAPs), and odors by converting (destroying) the emissions into CO2 and H2O through the use of heat before exhausting them to the atmosphere. This technology integrates a heat exchanger into the design in order to minimize the fuel used for oxidation. By passing the hot exhaust gasses through a non contact air-to-air primary heat exchanger, recovered heat is used to warm the incoming air to the oxidizer, making the system energy efficient The results provide you with exceptional performance, substantially reduced operating costs, and industry-leading reliability.
