The global Submucosal Injectable Composition market size is predicted to grow from US$ 152 million in 2025 to US$ 227 million in 2031; it is expected to grow at a CAGR of 7.0% from 2025 to 2031.

Submucosal Injectable Composition is designed to be used for submucosal lift of polyps, adenomas, early-stage cancers or other gastrointestinal mucosal lesions prior to excision with a snare or other endoscopic device.

With the continuous advancement of medical technology, the submucosal injectable composition has emerged as an innovative therapeutic approach gaining attention and traction. Submucosal injection involves the direct administration of drugs or therapeutic substances beneath the mucosal layer, allowing for more precise drug delivery and treatment. This method holds promise across various medical domains, particularly in the realms of gastrointestinal disorders, urological conditions, and more. As the demand for minimally invasive treatments grows, the submucosal injectable composition is poised to become a significant innovation within the medical field, tapping into substantial potential.
