The global Transfected Stable Cell Lines market size is predicted to grow from US$ 111 million in 2025 to US$ 160 million in 2031; it is expected to grow at a CAGR of 6.3% from 2025 to 2031.

Transfected stable cell lines are populations of cells that have been genetically modified through the process of transfection, where foreign nucleic acids (such as DNA or RNA) are introduced into the cells. These cells are distinct in that the transfected genetic material is stably integrated into the cell's genome or maintained as an episome (a self - replicating extra - chromosomal element), enabling long - term expression of the introduced genes. This stable integration or maintenance allows the cells to consistently express the transfected genes through multiple cell divisions, providing a reliable and reproducible system for various applications. They are widely used in research to study gene function, in biopharmaceutical production for the synthesis of recombinant proteins, and in drug development for screening and testing new compounds.
