The global Tube-Trough Acid Distributor market size is predicted to grow from US$ 82.17 million in 2025 to US$ 117 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

In 2025, global sales of Tube-Trough Acid Distributors were approximately 300 units, with a manufacturer-level average selling price of about USD 280,000 per unit. Gross margins among major manufacturers were approximately 28%–40%.

A Tube-Trough Acid Distributor is a critical tower internal used to distribute circulating acid uniformly within packed towers in sulfuric acid production facilities. It typically consists of an acid inlet header, distribution branch pipes, acid troughs, downcomer pipes, and supporting structures. The equipment adopts a two-stage distribution mechanism combining primary distribution through the piping system with secondary flow stabilization in the troughs. Acid is first conveyed through the main header and branch pipes into individual distribution troughs, where a relatively stable liquid level is established, and is then evenly delivered to the packing bed through downcomer pipes, overflow outlets, or distribution orifices. This configuration combines the high distribution-point density and compact structure of pipe-type distributors with the stable flow characteristics of trough-type distributors. It helps reduce channeling, localized erosion, and insufficient packing wetting, thereby improving acid coverage across the tower cross-section and supporting efficient gas–liquid mass transfer in drying, absorption, and heat-recovery processes.

The upstream supply chain mainly includes concentrated-sulfuric-acid-resistant stainless steel, specialized sulfuric-acid-resistant alloys, nickel-based corrosion-resistant alloys, welding consumables, pipes, plates, cast components, fasteners, and

structural supports. Material corrosion resistance, welding quality, and fabrication accuracy directly affect equipment service life and acid distribution uniformity. Downstream demand primarily comes from sulfur-burning acid plants, metallurgical off-gas acid plants, pyrite-based sulfuric acid plants, and other industrial sulfuric acid facilities. Tube-Trough Acid Distributors are installed in sulfuric acid drying towers, first absorption towers, final absorption towers, low-temperature heat-recovery towers, and oleum absorption towers, and operate together with circulating acid pumps, acid coolers, packing, mist eliminators, and tower shells as part of the drying and absorption system.

United States market for Tube-Trough Acid Distributor is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
