Urology morcellators are specialized medical devices used in urological surgeries, primarily for the removal of tissue during procedures such as kidney, prostate, or bladder surgery. These devices are designed to cut and fragment tissue into smaller pieces, which can then be more easily extracted through small incisions. Morcellators are commonly used in minimally invasive surgeries, where they help reduce the need for large incisions, leading to shorter recovery times, less pain, and a quicker return to normal activities for patients. The cutting mechanism of the morcellator is typically powered by an electric motor, allowing for precision and efficiency in tissue removal. However, due to potential risks associated with the spread of malignant tissue, their use has been carefully regulated in certain procedures, and alternatives are being explored for specific applications.

United States market for Urology Morcellators is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
