The global Vacuum Ultraviolet Irradiation and In-situ Measurement System market size is predicted to grow from US$ 35.37 million in 2025 to US$ 69.37 million in 2032; it is expected to grow at a CAGR of 10.0% from 2026 to 2032.

A Vacuum Ultraviolet Irradiation and In-situ Measurement System is an integrated optical, vacuum, environmental simulation and metrology system used to reproduce ultraviolet radiation conditions similar to the space environment on the ground. It normally consists of a vacuum chamber, VUV or UV radiation source, beam conditioning optics, sample stage, environmental control module, optical or physical property measurement unit, detectors and software. The system exposes materials to vacuum ultraviolet, far ultraviolet or near ultraviolet radiation and measures their properties before, during or after irradiation without removing the samples from the chamber, so that changes in optical, thermal, chemical or surface performance can be evaluated quantitatively.The system is mainly positioned for ultraviolet irradiation testing of aerospace materials and for supporting the design, selection and protection of satellite materials.

In 2025, global sales of Vacuum Ultraviolet Irradiation and In-situ Measurement System reached approximately 42 units, with an average global market price of around US$ 861 K/unit. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 60%.

United States market for Vacuum Ultraviolet Irradiation and In-situ Measurement System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
