## Abstracts

The global Industrial Mobile Robot Lithium Battery market size is predicted to grow from US$ 97 million in 2025 to US$ 232 million in 2031; it is expected to grow at a CAGR of 15.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Industrial mobile robot lithium battery is a lithium battery pack designed for industrial mobile robots that is efficient, portable, lightweight and has large capacity. Industrial mobile robot lithium battery refers to the battery pack carried by mobile robots used in the industrial field. This battery pack has the characteristics of high energy density, long life, high safety, etc., which can meet the long-term and high-intensity work needs of industrial mobile robots in various complex environments.

The driving factors of the lithium battery market for industrial mobile robots mainly include:

1. Technological progress: performance breakthrough and scene adaptation

Urgent demand for energy density improvement

Industrial mobile robots (such as humanoid robots, AGV/AMR) have extremely high requirements for endurance, but the energy density of traditional lithium batteries (such as ternary lithium about 240Wh/kg) is difficult to meet high energy consumption scenarios.

Technical direction:

Material innovation: Use new materials such as high-nickel ternary positive electrode, lithium-rich manganese base, silicon-carbon negative electrode, etc. to improve the energy density of single cells.

Solid-state battery: By replacing liquid electrolyte with solid electrolyte, the energy density is expected to exceed 400Wh/kg, while solving safety problems such as leakage and thermal runaway.

Fast charging and safety technology in parallel

Fast charging demand: Industrial scenarios require reducing downtime, and the technology of charging to 80% SOC in 6 minutes has been commercialized.

Safety upgrade: The non-flammable and non-volatile characteristics of solid-state batteries significantly reduce the risk of thermal runaway, and the AI-enabled BMS system realizes dynamic energy consumption prediction and fault warning.

Intelligent battery management system (BMS)

Through reinforcement learning to optimize management strategies, achieve action energy consumption prediction, dynamic power adjustment and energy recovery, and improve endurance efficiency.

2. Market demand: driven by industrial automation and emerging scenarios

Industrial automation penetration rate increases

Logistics and warehousing: The wide application of AGV/AMR in e-commerce and manufacturing has driven the demand for lithium batteries.

Automobile manufacturing: Flexible production lines rely more on mobile robots, requiring batteries to have high-rate discharge performance.

Special environment operations: such as rescue and exploration, batteries need to support extreme temperatures and complex working conditions.

3. Policy support: national strategy and industry standards promotion

National level support

China's '14th Five-Year Plan' clearly supports breakthroughs in core technologies of industrial robots, including upstream components such as batteries and motors.

Local governments encourage companies to develop high-performance lithium batteries through policies such as subsidies and tax incentives.

Improvement of industry standards

ISO/IEC 14443 and other standards promote the improvement of lithium battery compatibility and safety, and enhance market confidence.

Special standards for lithium batteries for robots (such as safety testing and cycle life) are gradually implemented.

4. Cost-effectiveness: economies of scale and substitution effect

Production cost reduction

The scale of lithium battery production has expanded, and the unit cost has decreased, which has driven the overall cost of industrial mobile robots to decrease.

The mass production process of solid-state batteries has accelerated, and it is expected that the cost will gradually decrease after the technology matures in 2025-2026.

Lead-acid battery replacement is accelerated

Lead-acid batteries still dominate the industrial field, but lithium batteries have gradually increased their penetration rate due to their long life and high energy density.

Lithium-powered AGV/AMR is already competitive in terms of total life cycle cost (TCO).

The driving factors of the lithium battery market for industrial mobile robots include technological breakthroughs, demand expansion, policy support, cost optimization, industry competition and environmental pressure. The maturity of solid-state battery technology, the acceleration of industrial automation, the release of policy dividends and
