Metal based precursors for semiconductors refer to metal source chemical precursors used for synthesizing semiconductor materials. They are usually metal compounds or metal organic compounds that are converted into the desired semiconductor materials through physical or chemical methods. Metal based precursors play a crucial role in the manufacturing of semiconductor materials, providing metal elements or metal ions to form semiconductor structures or alloys during the synthesis process. Metal based precursors can release metals or metal ions through chemical reactions or pyrolysis, and ultimately form chemical substances for semiconductor materials. These precursors can be used in various semiconductor manufacturing processes, such as chemical vapor deposition (CVD), metal organic chemical vapor deposition (MOCVD), atomic layer deposition (ALD), etc., for the preparation of high-performance semiconductor devices, integrated circuits, solar cells, sensors, etc.In 2024, global Metal Based Precursors for Semiconductors production reached approximately 535 MT, with an average global market price of around US$ 2,738 per MT.The annual production capacity of a single production line is 5-10 tons, and the gross profit margin is about 50%.

Upstream raw materials:

High-purity metal/metal source: such as ultra-high-purity hafnium ingots, zirconium ingots, titanium ingots, etc.
