Onshore wind turbine bearings are specialized mechanical components that play a crucial role in the operation of onshore wind turbines. These bearings are designed to support and enable the smooth rotation of various rotating parts within the wind turbine system. They are engineered to withstand high loads, including radial loads, axial loads, and combined loads, which are generated by the wind acting on the turbine blades and transmitted through the rotor shaft.

Onshore wind turbine bearings are typically made from high - strength materials such as high - carbon chromium bearing steel or other advanced alloys to ensure durability and resistance to wear, fatigue, and corrosion in the harsh outdoor environment where onshore wind turbines are usually installed. They come in different types, such as main shaft bearings, yaw bearings, and pitch bearings, each with specific functions and design characteristics to meet the requirements of different parts of the wind turbine. For example, main shaft bearings support the main shaft that connects the rotor blades to the gearbox or generator, enabling the transfer of rotational energy; yaw bearings allow the nacelle to rotate and align with the wind direction; pitch bearings adjust the angle of the turbine blades to optimize power generation and protect the turbine under high - wind conditions.
