The global Organic Scintillators market size is predicted to grow from US$ 134 million in 2025 to US$ 173 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Organic scintillators are aromatic hydrocarbon compounds which contain benzene ring structures interlinked in various ways. Their luminescence typically decays within a few nanoseconds.

Some organic scintillators are pure crystals. The most common types are anthracene (C14H10, decay time ?30 ns), stilbene (C14H12, 4.5 ns decay time), and naphthalene (C10H8, few ns decay time). They are very durable, but their response is anisotropic (which spoils energy resolution when the source is not collimated), and they cannot be easily machined, nor can they be grown in large sizes; hence they are not very often used.
