Abstracts

The global Outdoor Delivery Robot market size is predicted to grow from US$ 681 million in 2025 to US$ 1226 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

In 2025, global outdoor delivery robot production reached approximately 8698 units, the average price is 80 k usd/unit. Outdoor delivery robot is an intelligent robot designed to drive autonomously and complete goods delivery tasks in outdoor environments such as public sidewalks and streets. It usually integrates multiple functions such as environment perception, positioning navigation, path planning, obstacle avoidance and human-computer interaction. It senses the surrounding environment through multi-sensor fusion and relies on electric power to drive packages, takeaway or retail goods from delivery points to designated receiving locations safely and efficiently. It is one of the key equipment to realize 'last kilometer' automatic distribution.

Market Concentration and Key Players:

Internationally, the market concentration degree of outdoor delivery robot is relatively high, mainly concentrated in developed countries such as Europe and America. For example, Kiwibot and Segway Robotics and other large manufacturers; from the domestic point of view, outdoor delivery robots still have a lot of room for development.

Manufacturing Processes and **Market Trends:**

The manufacturing process of the outdoor delivery robot is a complex electromechanical and soft integration project. It starts from the design and manufacture of a solid chassis and walking system. It needs to integrate motors, reducers and

suspensions to ensure stable movement under complex road conditions. The core lies in the fusion assembly of multi-sensor systems, including the precise installation and calibration of laser radar, camera, millimeter wave radar and GPS module to build the real-time perception of the surrounding environment. The upper master control system integrates high-performance computing units. Equipped with algorithm software such as synchronous positioning and mapping, path planning and obstacle recognition, this is the 'brain' for its autonomous navigation. The shell is usually made of lightweight and weather-resistant composite materials to protect the internal precision components and adapt to outdoor wind and rain environment. After the whole machine is assembled, it must undergo a large number of strict tests in closed scenes and open roads to continuously optimize its decision-making logic and safety.

The market trend is evolving towards a higher level of intelligence and collaboration. The environmental understanding and long-distance endurance of a single robot continue to be enhanced. Meanwhile, the fleet-level dispatching system realizes multi-machine coordination and optimal efficiency through cloud management. Commercial landing is gradually moving from closed and semi-closed scenes such as parks and campuses to open municipal roads. Corresponding laws, regulations and public safety standards have become key driving or restricting factors. In addition, it is closely related to intelligent express cabinets, The automatic docking function of retail stores and more natural human-computer interaction interface have also become the focus of product differentiation competition. The whole industry is actively exploring sustainable large-scale operation business model while pursuing technical reliability.
