The global Solid Polyaluminum Iron Chloride market size is predicted to grow from US$ 146 million in 2025 to US$ 178 million in 2031; it is expected to grow at a CAGR of 3.4% from 2025 to 2031.

Polyaluminum ferric chloride (polyaluminum ferric chloride) is a new type of composite amorphous, inorganic polymer water purifier mainly composed of aluminum and supplemented by iron (with an iron content of about 2-3%). Iron is a high valent iron that forms a multi-core complex upon hydrolysis. At low temperatures, it has the characteristics of a high proportion of alum flowers formed in water and dense alum flowers formed. This is mainly due to the fact that the hydrolysis rate and process of iron salts are less affected by temperature. Due to the color removal performance of aluminum salts, the chromaticity of the resulting water is greatly reduced. So it has the characteristics and features of PAC and iron salts, overcoming the water purification difficulties of PAC at low temperatures and low turbidity. Therefore, its water purification effect is better than that of general water purification products. Solid polyaluminum iron chloride (PAC Fe) is a polymer containing aluminum and iron, widely used in the fields of water treatment and wastewater treatment. It is usually generated by reacting salts of aluminum chloride and iron under certain conditions.
